

DIY CD Label – *Quick instruction*

Thanks for your purchase of ATake products.

The files that you downloaded from ATake website are template documents that provide the layout for A4-3a and A4-3b labels. There are 3 sets of **jpg**, **pdf** and **ai** file format for your CD or DVD label. To start designing your CD or DVD label, run the software like Adobe Photoshop (recommended!), Illustrator, Acrobat, or other image processing software that came with your computer.

Following is a tutorial on how to make labels using Adobe Photoshop.

1. Creating your labels.

- Start Adobe Photoshop.
- Open "**CD-Lable-Daicut-3b.jpg**" or the other 2 files for 3b format.
- Insert photos to your labels.
- Resize or move each image as needed so that it fits in the label.
- Add text to your label, and arrange it as desired.

2. Save your labels.

- From the **File** menu, select **Save**.
- In the **Save As** window, locate and open the folder where you want to save the labels.
- Type a name for your labels, then click **Save**.

3. If you want to preview your labels.

- From the **File** menu, select **Print Preview**.
- Or, click the **Print Preview** button.
- When you are done previewing, click **Close** to close the preview window.
- Click on **File** and press on **Print**.

4. Peel the labels off and affix it on CD or DVD evenly to complete your perfect work.

- 5. If your disc printer is an inkjet model, be sure to allow the ink to dry for 24 hours before using the disc.

If the problem still exists, please contact our Agent in Singapore directly for further assistance.
